

Linear Control Systems

Laboratory Experiment 4: Linear Time-invariant Systems and Representation

Objectives: This experiment has following two objectives:

1. Continued with the learning of Mathematical Modeling from previous experiment, we now start focusing the linear systems. We will learn commands in MATLAB that would be used to represent such systems in terms of transfer function or pole-zero-gain representations.
2. We will also learn how to make preliminary analysis of such systems using plots of poles and zeros locations as well as time response due to impulse, step and arbitrary inputs.

List of Equipment/Software

Following equipment/software is required:

- MATLAB

Category Soft-Experiment

Deliverables

A complete lab report including the following:

- Summarized learning outcomes.
- MATLAB scripts and their results should be reported properly.

Mass-Spring System Model

The spring force is assumed to be either linear or can be approximated by a linear function $F_s(x) = Kx$, B is the friction coefficient, $x(t)$ is the displacement and $F_a(t)$ is the applied force:

The differential equation for the above Mass-Spring system can be derived as follows

$$M \frac{d^2 x(t)}{dt^2} + B \frac{dx(t)}{dt} + Kx(t) = F_a(t)$$

Transfer Function:

Applying the Laplace transformation while assuming the initial conditions are zeros, we get

$$(Ms^2 + Bs + K) * X(s) = F_a(s)$$

Then the transfer function representation of the system is given by

$$TF = \frac{\text{Output}}{\text{Input}} = \frac{F_a(s)}{X(s)} = \frac{1}{(Ms^2 + Bs + K)}$$

Linear Time-Invariant Systems in MATLAB:

Control System Toolbox in MATLAB offers extensive tools to manipulate and analyze linear time-invariant (LTI) models. It supports both continuous- and discrete-time systems. Systems can be single-input/single-output (SISO) or multiple-input/multiple-output (MIMO). You can specify LTI models as:

Transfer functions (TF), for example,

$$P(s) = \frac{s + 2}{s^2 + s + 10}$$

Note: All LTI models are represented as a ratio of polynomial functions

Examples of Creating LTI Models

Building LTI models with Control System Toolbox is straightforward. The following sections show simple examples. Note that all LTI models, i.e. TF, ZPK and SS are also MATLAB objects.

Example of Creating Transfer Function Models

You can create transfer function (TF) models by specifying numerator and denominator coefficients. For example,

```
>>num = [1 0];
>>den = [1 2 1];
>>sys = tf(num,den)
```

Transfer function:

```
      s
-----
s^2 + 2 s + 1
```

A useful trick is to create the Laplace variable, s. That way, you can specify polynomials using s as the polynomial variable.

```
>>s=tf('s');
>>sys= s/(s^2 + 2*s + 1)
```

Transfer function:

$$\frac{s}{s^2 + 2s + 1}$$

This is identical to the previous transfer function.

Example of Creating Zero-Pole-Gain Models

To create zero-pole-gain (ZPK) models, you must specify each of the three components in vector format. For example,

```
>>sys = zpk([0],[-1 -1],[1])
```

Zero/pole/gain:

$$\frac{s}{(s+1)^2}$$

produces the same transfer function built in the TF example, but the representation is now ZPK. This example shows a more complicated ZPK model.

```
>>sys=zpk([1 0], [-1 -3 -.28],[.776])
```

Zero/pole/gain:

$$\frac{0.776 s (s-1)}{(s+1) (s+3) (s+0.28)}$$

Plotting poles and zeros of a system:

pzmap

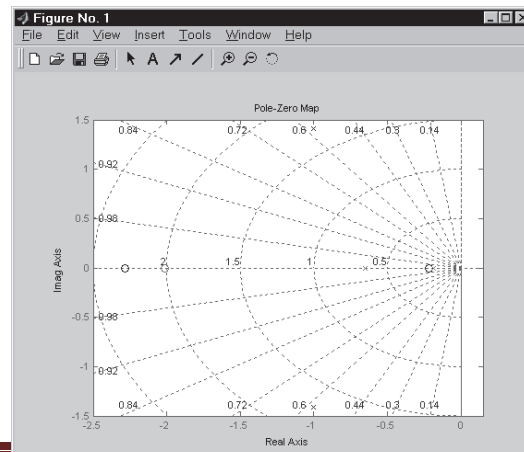

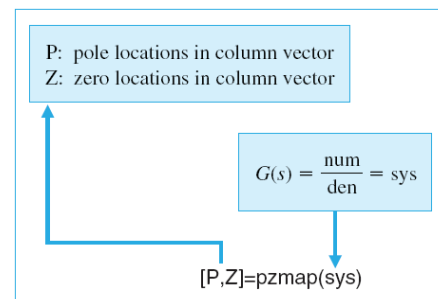

Compute pole-zero map of LTI models

```
pzmap(sys)
pzmap(sys1,sys2,...,sysN)
[p,z] = pzmap(sys)
```

Description:

`pzmap(sys)` plots the pole-zero map of the continuous- or discrete-time LTI model `sys`. For SISO systems, `pzmap` plots the transfer function poles and zeros. The poles are plotted as x's and the zeros are plotted as o's.

`pzmap(sys1,sys2,...,sysN)` plots the pole-zero map of several LTI models on a single figure. The LTI models can have different numbers of inputs and outputs. When invoked with left-hand arguments,

`[p,z] = pzmap(sys)` returns the system poles and zeros in the column vectors `p` and `z`. No plot is drawn on the screen. You can use the functions `sgrid` or `zgrid` to plot lines of constant damping ratio and natural frequency in the `s`- or `z`- plane.

Example

Plot the poles and zeros of the continuous-time system.

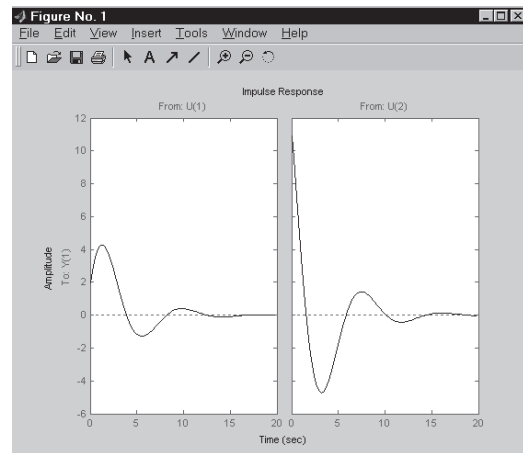

$$H(s) = \frac{2s^2 + 5s + 1}{s^2 + 2s + 3}$$

```
>>H = tf([2 5 1],[1 2 3]); sgrid
>>pzmap(H)
```

Simulation of Linear systems to different inputs

impulse, step and lsim

You can simulate the LTI systems to inputs like impulse, step and other standard inputs and see the plot of the response in the figure window. MATLAB command 'impulse' calculates the unit impulse response of the system, 'step' calculates the unit step response of the system and 'lsim' simulates the (time) response of continuous or discrete linear systems to arbitrary inputs. When invoked without left-hand arguments, all three commands plots the response on the screen. For example:

To obtain an impulse response

```
>> H = tf([2 5 1],[1 2 3]);
>> impulse(H)
```

To obtain a step response type

```
>> step(H)
```

Time-interval specification:

To contain the response of the system you can also specify the time interval to simulate the system to. For example,

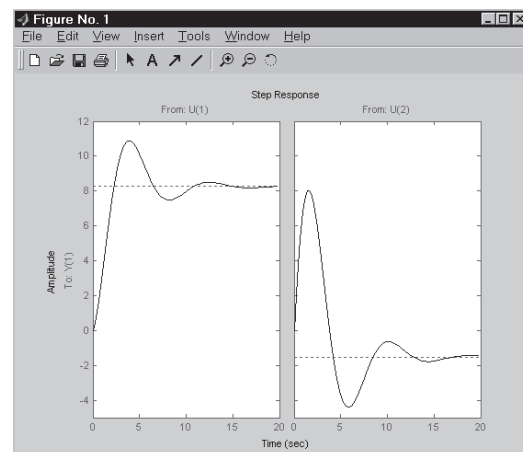

```
>> t = 0:0.01:10;
>> impulse(H,t)
```

Or

```
>> step(H,t)
```

Simulation to Arbitrary Inputs:

To simulate the (time) response of continuous or discrete linear systems to arbitrary inputs use

'lsim'. When invoked without left-hand arguments, 'lsim' plots the response on the screen.

lsim(sys,u,t) produces a plot of the time response of the LTI model sys to the input time history 't','u'. The vector 't' specifies the time samples for the simulation and consists of regularly spaced time samples.

$T = 0:dt:T_{final}$

The matrix u must have as many rows as time samples (length(t)) and as many columns as system inputs. Each row $u(I,\odot)$ specifies the input value(s) at the time sample $t(i)$.

Simulate and plot the response of the system

$$H(s) = \frac{2s^2 + 5s + 1}{s^2 + 2s + 3}$$

to a square wave with period of four seconds.

First generate the square wave with gensig. Sample every 0.1 second during 10 seconds:

```
>>[u,t] = gensig('square',4,10,0.1);
```

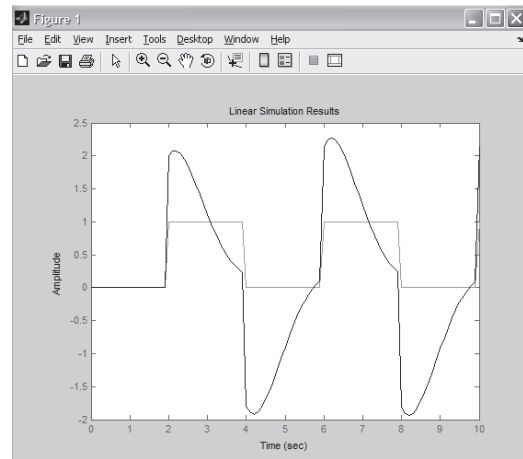

Then simulate with lsim.

```
>> H = tf([2 5 1],[1 2 3])
```

Transfer function:

$$\frac{2s^2 + 5s + 1}{s^2 + 2s + 3}$$

```
>> lsim(H,u,t)
```

Exercise 1:

Consider the transfer function

$$G(s) = \frac{6s^2 + 1}{s^3 + 3s^2 + 3s + 7}$$

Using MATLAB plot the pole zero map of the above system

Exercise 2:

- a. Obtain the unit impulse response for the following system

$$\frac{B(s)}{A(s)} = \frac{1}{s^2 + 0.2s + 1}$$

- b. Obtain the unit step response for the following system

$$\frac{B(s)}{A(s)} = \frac{s}{s^2 + 0.2s + 1}$$

- c. Explain why the results in a. and b. are same?

Exercise 3:

A system has a transfer function

$$\frac{X(s)}{R(s)} = \frac{(15/z)(s + z)}{s^2 + 3s + 15}$$

Plot the response of the system when R(s) is a unit impulse and unit step for the parameter z=3, 6 and 12.

Exercise 4:

Consider the differential equation $\ddot{y} + 4\dot{y} + 4y = u$ where $y(0) = \dot{y}(0) = 0$ and $u(t)$ is a unit step. Determine the solution analytically and verify by co-plotting the analytical solution and the step response obtained with 'step' function.
